Abstract: Acute Otitis Media (AOM) is the second most prevalent disease in children after Upper Respiratory Tract Infection (URTI). AOM prevalence varies in different countries, ranging between 2.3 - 20%. Epidemiological studies of AOM in developing countries are very rare. As of today, no prevalence data of AOM found in North Sumatera. Thus, there needs to be epidemiological data to establish prevention strategy and treatment based on population profile. The objective of this study is to acquire prevalence data and patient profiles of AOM in North Sumatera. This is a descriptive study with a cross-sectional design. The study population is all the people living in North Sumatera Province selected through Simple Random Sampling in several chosen sub-districts. The inclusion criteria of this study are the total population who are willing to be the subject of this study. AOM patients were found as many as 37 of 1726 subjects. Therefore, the prevalence of AOM is 2.1%. Women comprise more of the group (51.4%). The most prevalent age group is 0-5 years old (45.9%). The most prevalent symptom is otalgia (37.8%). The prevalence of AOM in North Sumatera is 2.2%. There is a need for better ear care and screening program for early detection of this disease.

I. INTRODUCTION

AOM is the second most prevalent disease found in children after URTI. AOM may affect all ages, but most prevalently found in babies and children aging from three months to three years old [1]. Peak incidence is within the 18-20 months old age group. Highest global prevalence is in children aging one to four years old (60.99%) and children aging less than one years old (45.28%). The number of cases of AOM in adult increases as much as

2.3% after 75 years of age [2].

AOM prevalence varies in different countries, ranging between 2.3 - 20%. Various epidemiological studies in the United States show that the prevalence of AOM case in the first two years of life is as much as 17-20%. The annual cost of antibiotic administration to counter AOM in the United States is around USD 3-5 million. The prevalence of AOM in other developed countries is almost the same as that of the US. Epidemiological studies of AOM

in developed countries are very rare [3, 4].

In Southeast Asia, Indonesia holds the rank as the fourth country with highest prevalence of ear diseases (4.6%). The other three countries are Sri Lanka (8.8%), Myanmar (8.4%), and India (6.3%). Although not the highest, but 4.6% prevalence is considered immense to cause social problem within the community - for instance, it affects communication. According to the survey result of seven provinces in Indonesia, AOM is the leading cause of morbidity of the middle ear [5, 6].

There aren't any official national data reporting AOM prevalence. According to the survey on hearing health conducted in 1994-1996 in 7 provinces in Indonesia, it is found that the prevalence of middle ear diseases in Indonesia was as much as 3.9%. Of all the studies from 12 regions in Indonesia, in 2012, AOM is most prevalently found in school-age children. Total prevalence of acute otitis media, otitis media with effusion, and chronic suppurative otitis media were 5/1000, 4/1000, and 27/1000 of children [3].

As of today, no AOM prevalence and patient profile data that is certain enough to represent the patients' profile in North Sumatera. With that fact in mind, we would like to fill the absence.

II. METHOD

This is an observational study in descriptive form with cross-sectional design aiming to find the prevalence data of AOM in North Sumatera.

The study population is all the people living in North Sumatera Province who were selected through Simple Random Sampling in several chosen sub-districts, which were Tanjung Morawa Sub-District, Stabat Sub-District, Sibolga Sub-District, and Pandan Sub-District. The inclusion criteria of this study is the total population who are willing to be the subject of this study and the exclusion criteria of this study are those with suppurative otitis media, external otitis, and ear canal atresia.

Subject selection began with stratification within the district/ municipality level. Districts/ municipalities were sorted based on occupant percentage from BPS (Badan Pusat Statistik/ Statistics Indonesia) data in the year 2014. From the data, the districts were divided into two groups, which are (1) those with low percentage of underprivileged people ($\leq 12.86\%$) and (2) those with high percentage of underprivileged people ($>12.86\%$). From each of the groups, two districts/ municipalities were then chosen through simple random sampling. The chosen ones were Deli Serdang district, Langkat district, Sibolga municipality, and Middle Tapanuli municipality. From each of them, a list of sub-district was formed. One

district was then chosen out of the list through simple random sampling.

All of the samples that fulfilled the criteria signed a written informed consent and proceeded with anamnesis and physical examination. All of the data collected were then analyzed and presented in frequency distribution table for each of the variable assessed.

III. RESULTS

This study is participated by 1726 samples originating from chosen districts/ municipalities in North Sumatera, which comprises of 855 men (49.5%) and 871 women (50.5%).

TABLE 1
FREQUENCY DISTRIBUTION OF THE RESPONDENTS

Diagnosis	<i>n</i>	%
Age		
Normal	1.554	90
Otitis Externa	67	3.8
OME	7	0.4
CSOM	61	3.5
AOM	37	2.2
Total	1.726	100

TABLE 2
ACUTE OTITIS MEDIA CHARACTERISTICS

Characteristics	<i>n</i> = 37	%
Sex		
Men	18	48.6
Women	19	51.4
Age		
0 - 5 years old	17	45.9
6 - 11 years old	13	35.1
≥ 12 years old	7	18.9
Chief Complaints		
Hearing Problem	5	13.5
Ear Pain	14	37.8
Ear Discharge	10	27
Sensation of fullness in ear	8	21.6
Stadium		
Hyperemic	5	13.5
Occlusion	13	35.1
Perforation	10	27
Suppuration	9	24.3

The result of ENT (ear, nose, and throat) physical examination shows that 36 participants were suffering from unilateral acute otitis media and 1 participant suffered from bilateral acute otitis media. This shows that the prevalence of acute otitis media from this study is as much as 2.2%.

This study was participated by 37 subjects who fulfilled the inclusion criteria. Of all the subjects, 18 are men (48.6%) and 19 are women (51.4%) with the most prevalent age group is 0 - 5 years of age.

Ear pain is the most prevalent chief complaint of AOM in 14 participants (37.8%), followed by ear discharge in 10 participants (27%). Sensation of fullness in ear was reported by 10 participants (27%) and hearing problem was reported by 5 participants (13.5%).

Through ENT physical examination, the most prevalent AOM stadium found is occlusion in 13 participants (35.1%), followed by perforation in 10 participants (27%). Suppuration in 9 participants (24.3%) each, and hyperemia in 5 participants (13.5%).

IV. DISCUSSION AND CONCLUSION

This study was conducted in several chosen regions that represent North Sumatera Province. It was executed from January - March 2016, where as much as 1726 subjects participated. This community based study involved various structures in the society, including government administration, community health center, and health cadres as community's health partners.

The prevalence of AOM in North Sumatera found in this study is as much as 2.2%. This number corresponds to previous studies, where AOM prevalence varies between 2.3 - 20%.

Several published studies assessed otitis media data in children from different countries of the world. In another study, Bardach et al reported AOM incidence of 1.171 - 36.000/ 100.000 children, with the highest incidence in the below 5 years old age group in South America and the Caribbean. In Asia Pacific countries, otitis media prevalence in school-age children is reported to vary between 3.25% (Thailand) and 12.23% (Phillipines) [7].

This study shows that female group comprised of more participants (51.4%) than that of male (48.6%).

Similar report published by [8] which shows that male:female ratio of the case is 1:1.2. Olubango in another study found that cases with less number of female participants is more dominant. On the other hand, Homoe et al concluded no different distribution between female and male groups. [9] also found no significant difference in AOM prevalence between different sex groups. As of today, no certain mechanism support the contribution of

sex as the risk factor of AOM [3, 8, 9, 10].

This study found that the most prevalent age group is that of 0 - 5 years of age (45.9%), followed by 6 - 11 years old age group (35.1%), and ≥ 12 years old group (18.9%).

Study done by [3], reported that the highest prevalence of otitis media was found in the 2 - 5 years old age group (44.4%). According to bivariate and multivariate analysis, < 5 years of age is the most significant risk factor and a dominant factor of acute otitis media. Children aged < 5 years old has 10 times greater risk of developing acute otitis media compared to those aged 5 years and above [3].

Based on study conducted by [11], the incidence of acute otitis media that was diagnosed within her prospective study was as much of 256/1000 people within a year. The incidence of acute otitis media is higher in 0 - 2 years old age group compared to that of 3 - 5 years old age group [11].

Globally, acute otitis media incidence is estimated to be as much as 11% annually, exposing 709 cases annually. The peak of incidence falls into 1 - 4 years old age group (61%) [12].

Babies and children have the highest risk factor to develop acute otitis media, where the peak of prevalence falls between the age of 3 - 36 months old. This is also due to the underdeveloped eustachian tube in children, which will only complete in adult years. Their eustachian tube is shorter and more horizontally positioned, contributing to the easy drainage of nasofaring secretion to the middle ear [3, 13].

This study found that the most prevalent chief complaint is ear pain, which was reported in 14 participants (37.8%), followed by ear discharge in 10 participants (27%). Sensation of fullness in ear was reported by 10 participants (27%) and hearing problem was reported by 5 participants (13.5%).

Generally, otitis media present the following symptoms: ear pain (otalgia), fever, hearing decline, and mucopurulent discharge (otorrhea) through tympanic membrane perforation. In babies, where otitis media cases are most prevalently found, symptoms may not be specific: restless, irritable, no appetite, vomiting, fever, and sometimes accompanied by seizure. A study conducted in Finland shows that risk of otitis media increase in children who suffer cough, nose infection, and ear pain. In Nigeria, Akoai et al found otorrhea and otalgia symptoms to be as much as 20% and 13% respectively [13].

The most prevalent stadium found in this study is occlusion of the eustachian tube in 13 participants (35.1%), followed by perforation of the tympanic membrane in 10

participants (27%). Suppuration in 9 participants (24.3%) each, and hyperemia in 5 participants (13.5%).

According to study by [11] the most prevalent clinical signs found are tympanic membrane hyperemia (52.8%) and ear pain (48.4%). Ear discharge was found 14.4% of all cases [11].
